Generalities. In programming languages with a built-in Boolean data type, such as Pascal and Java, the comparison operators such as > and % are usually defined to return a Boolean value. Conditional and iterative commands may be defined to test Boolean-valued expressions.. Languages with no explicit Boolean data type, like C90 and Lisp, may still represent truth values by some other data type.

This is a very similar breakdown to what I teach my students, but I think you've missed an important principle: iteration. An analysis never flows smoothly from collection to conclusions – you will often repeat many parts, discovering problems with your data when you model it, thinking of better models after you've looked at residuals, etc!
