Geometry (from the Ancient Greek: $\gamma\epsilon\omicron\mu\epsilon\tau\epsilon\tau\iota\kappa\acute{\eta}$; geo-"earth", -metron "measurement") is a branch of mathematics concerned with questions of shape, size, relative position of figures, and the properties of space. A mathematician who works in the field of geometry is called a geometer.. Geometry arose independently in a number of early cultures as a practical way for dealing with lengths ...

In mathematics, a plane is a flat, two-dimensional surface that extends infinitely far. A plane is the two-dimensional analogue of a point (zero dimensions), a line (one dimension) and three-dimensional space. Planes can arise as subspaces of some higher-dimensional space, as with a room's walls extended infinitely far, or they may enjoy an independent existence in their own right, as in the ...

Three Point Geometry Axioms for the Three Point Geometry: 1. There exist exactly 3 points in this geometry. 2. Two distinct points are on exactly one line. 3. Not all the points of the geometry are on the same line. 4.

The usual way of representing a bounded planar surface (facet) in computer graphic applications is as a sequence of vertices. Shading algorithms and ray-tracing generally requires knowledge of the normal to the facet, this is calculated by taking the cross product two of the edge vectors of the facet.

Space-time is a mathematical model that joins space and time into a single idea called a continuum. This four-dimensional continuum is known as Minkowski space.. Combining these two ideas helped cosmology to understand how the universe works on the big level (e.g. galaxies) and small level (e.g. atoms).. In non-relativistic classical mechanics, the use of Euclidean space instead of space-time ...
